

Controls

A status update

The new generation of risk assessments for trading algorithms — a live picture instead of a document.

Your name · August 2026

Ten years of evolution

FISH

FISH + BIRD

FISH + BIRD + APE

FISH + BIRD + APE + HUMAN

HUMAN

Nothing was ever removed — every stage kept the one before it.

One change, one reviewer

- 1 Control changed by admin team or via request from Audit
- 2 New generation of cra activity or cra guidance released, triggering new assessments to be re-created
- 3 Guidance updated in a single isolated control

1 Control changed

9	☒	_____
10	☒	_____

2 Full assessment re-run

3 Single control update

01 · THE PROBLEM

4 mo

what a single assessment restart costs after any change — while the algorithm waits for LTO

How it works

Controls

Requirements split into independent blocks — each with its own owner and lifespan.

Assembled on demand

An assessment is built from live controls, not a document.

Reused everywhere

One control serves many assessments — filled in once.

What it means for the business

- + Business efforts reduced by change isolation and reuse of controls in different assessments
- + Tech and Admin teams efforts reduced by a flexible data model with changes on the fly
- + The risk picture is always current — nothing is stale on arrival.

One year in – what's next

Q3 25	Q4 25	Q1 26	NOW	NEXT
Build	Validate	Pilot	Rollout	Full switch
development starts	user testing rounds	two pilot algorithms	more assessments live	legacy retired

Dates past “now” are the plan — milestones to be confirmed with the teams.
